

SIH COMPETITOR MARKET

Platform	Blood availability	Blood donor matching	Hospital bed availability	Nearest hospital	Hospital-side management	AI/patient problem understanding
e-RaktKosh	✓	✓ Donor registration	✗/Limited	✓ Nearby hospitals/ blood banks	✓ Blood-bank management	✗
e-BloodBank	✓	✓ Donor registration	✗	✓	✓ Blood-bank stock updating	✗
DokLink	✗	✗	✓ Real-time beds	✓	✓	⚠ Smart recommendation
XparkAI	✓	⚠	✓	✓	✓	✓ AI health chat
Zuzu Healthcare	✓ Blood banks	✓ Blood donors	⚠ Hospital capacity	✓	✓	⚠
iRelief	✓	✓	✓	✓	⚠	✗
TALBloodAid	✗	✓ Blood-group + location matching	✗	✗	✗	✗

1. 💧 e-RaktKosh — your biggest competitor for the blood component

e-RaktKosh is probably the **most important existing system** we should study.

It allows users to search blood availability by **state, district, blood group, component and location**, and also provides blood-bank directories, donation camps and donor registration. The platform is operated under India's Ministry of Health & Family

[e-RaktKosh official portal](#) (Dormant, kai kore na)

But: our concept isn't simply "find blood."

Our concept is:

Patient needs blood → identify suitable nearby voluntary donors → connect them → simultaneously identify an appropriate nearby hospital with an available bed.

That's a much broader emergency-navigation problem.

2. e-BloodBank — surprisingly close to part of our idea

The Government/NIC's **e-BloodBank** app actually says it can provide:

- nearby hospitals
- nearby blood banks
- blood-group-wise availability
- navigation
- emergency hospital contact
- donor registration
- blood-stock updates by blood banks

So **don't claim in your SIH presentation that nobody has ever attempted this.**

Instead, say:

"Existing platforms address individual healthcare resources such as blood availability or hospital discovery, but our proposed system focuses on intelligent, integrated emergency navigation connecting the patient, hospital capacity and voluntary blood donors through a single coordinated workflow."

That's much stronger.

3. DokLink — very close to your hospital-bed concept

DokLink is particularly relevant.

It proposes **real-time availability of general, ICU, HDU and emergency beds** and uses factors such as:

- bed availability
- distance
- resources
- insurance

to recommend an appropriate hospital. It also has a hospital-side system through which hospitals can make their capacity visible.

[DokLink official website](#) (Patients der jonne app akn o Khole nil, just for hospital seatao paid)

This means your **"hospital authority enters available beds → patient finds suitable hospital"** concept is not completely new.

But DokLink isn't the same as your complete ecosystem because your concept also incorporates **blood donor matching and emergency patient interaction.**

4. 🤖 XparkAI — this one is VERY interesting for our SIH team

XparkAI is probably one of the closest conceptual competitors I found.

It combines:

- AI health chat
- emergency SOS
- nearby hospitals
- live hospital beds
- blood-bank information
- ambulance
- location-based emergency assistance

It specifically describes an emergency mode that can surface a **nearest hospital with live bed count and a blood bank with the required blood type**.

[XparkAI official website](#) (Its too a dormant website, kono naj kore na just showing join the waitlist)

This is the competitor I'd study most carefully.

Because if our SIH judges search the internet, **they could point to something like XparkAI and ask, "How is your solution different?"**

So we need a strong differentiation.

5. 🩸 TALBloodAid — close to our donor-matching idea

TALBloodAid provides **blood-group and location-based matching** between donors and people requiring blood/platelets. It also supports donor notifications and location/radius-based searches.

So our:

"I need B+ → show me willing B+ donors near me"

is also not entirely novel.

Our innovation should therefore be **how donor matching is integrated into the entire emergency-care journey**, rather than claiming donor matching itself is new.

P.T.O

6. iRelief — another surprisingly close example

iRelief has offered:

- blood banks
- blood donors
- ambulance
- hospitals
- hospital bed information
- ICU availability
- hospital locations
- navigation
- direct calling

Its description specifically mentions showing hospitals along an ambulance route and providing information such as normal-bed and ICU availability.

[iRelief official website](#) (Worst user interface no separate app for user and donors and hospital management)

So again, **the individual features already exist in different combinations.**

So is our idea already available?

My assessment:

Exact same concept: I didn't find a clearly established platform that matches our complete architecture.

Individual features: Yes, many already exist.

And I think that's completely normal for an SIH project.

Our project doesn't need to invent "hospital search" or "blood donor search" from zero.

Our innovation should be the **integration + intelligence + rural/emergency optimization.**
